1.1 Purpose

The Food Ordering System can be defined as a simple and convenient way for customers to purchase food online, without having to go to the restaurant. This system is enabled by the internet - it is the internet that connects the restaurant or the food company on one hand, and the customer on other hand. Therefore, as per this system, the customer visits the restaurant's app or website, browses through the various food items, combos and cuisines available there and goes ahead and selects and purchases the items he or she needs.

These items will then be delivered to the customer at his or her doorstep at the time they choose by a delivery person. Payments for such online orders can be made through debit cards, credit cards, cash or card on delivery, or even through digital wallets

1.2 Intended Audience and Reading Suggestions

The SRS document is intended for all the stakeholders to confirm on all the requirements and features before initiating development. Stakeholders include the sponsors, Management team, Q/A staff Product Champion (from each user group i.e. customers, shop keepers, office workers, Mall staff, Food brands). The document states project scope with detail explanation of features and specifications. It will help for all the users to understand about the project and Q/A staff to prepare testing cases accordingly. The document also includes some limitations and constraints and the operating requirement in which the system would work.

1.3 Product Scope

The Scope of the project (website) are as follows: Food Ordering Website can sale Food product, preferred brands, kitchen needs, essential restaurant supplies and more, through this online, one- stop Food store. It provides you with a convenient way to sale from your Food shopping website.

2.1 Product Perspective

The Online Food Order System application is a web-based system. This web site provide complete product to place review, order and order processing. It can be accessed through internet browsers on pc, mobile etc..

2.2 Product Functions

Customer Features

- ➔ Customer Registration and Login
- ➔ Choose Restaurant
- ➔ View Menu Restaurant
- ➔ View Offer
- ➔ Food category
- ➔ Discount on Cards
- ➔ Add to Cart Food
- ➔ Delete the Food from Cart

2.3 Design and Implementation Constraints

The online Food Ordering System is developed in Spring Boot as the backend framework, using Spring Boot REST APIs, Microservices and Spring cloud are required, Aspect-Oriented Programming (AOP) must be used

2.4 Apportioning of Requirements

For online Food Ordering System , several functions are omitted. These functions might be implemented in the future such as upgrade the system by connecting to mobile application.

3. System Features

- ✓ Your restaurant closes at night, your website does not. Customers can see your menu and schedule orders any time day or night for when you are open. Your online "waiter" will never complain!.
- ✓ Unlimited menu categories & items. List your whole menu. Including catering menu. Additionally, upload pictures for each menu item.
- ✓ Customers can securely pay for their order online using their credit card or they can pay in person. Whichever is convenient for you. We support both options.
- ✓ Offer delivery? Only offer delivery service? Your online ordering system can be configured to only accept delivery orders. Customer indicate delivery when placing their order.
- ✓ Your fax machine or printer will print out your customer's order (E-mail also sent). You'll get an automated call or a text message alert to let you know as soon as an order is placed.
- ✓ After an order is placed, our system will either give you a phone call or text alert (based on your settings) to let you know you have an online order.

4. Nonfunctional Requirements

The Website should provide greater performance with no delay. For food brands the performance should be good and queries with minimum "join" statements are preferred for better and fast results. Too many tables in database can result in slower execution of queries, hence effecting the entire system

4.1 Graphical Interface

User who uses Your System need a Graphical interface of System Without that user cannot be operated properly. If the Interface is Not Graphical General user are able to understand the system,

4.2 Reliability

The application should be reliable and it should generate all updated information in correct order. Like as a 1.0, 1.1 etc...

4.3 Availability

Application will be available and working properly for all the time (24*7).

4.4 Security

- Every user and Admin must change his initial password after first successful login
- If any user uses his credit card for payment, OTP is sent via text or call for confirmation
- The user shall receive a text message by bank on successful transaction.
